

Employee Attrition Analysis – Executive Summary

Project Objective

Employee turnover can be costly for any organization due to recruitment expenses, training costs, and productivity loss. The goal of this project was to identify patterns that indicate which employees are more likely to leave the company and understand the factors that contribute to employee turnover.

What We Analyzed

The analysis was conducted using employee data containing information such as job role, department, salary, work-life balance, years of service, job satisfaction, and other workplace-related factors. The objective was to determine which employee characteristics were most closely associated with employees leaving the organization.

Key Findings

Several clear patterns emerged from the analysis:

- Employees with lower salaries were more likely to leave compared to higher-paid employees.
- Employees with fewer years at the company showed a higher tendency to resign, particularly during the early stages of employment.
- Poor work-life balance was strongly associated with increased employee turnover.
- Certain departments and job roles experienced noticeably higher attrition rates than others, indicating that turnover is not evenly distributed across the organization.
- Employee retention appears to be influenced by a combination of salary, work environment, and career development factors rather than compensation alone.

Business Impact

The analysis shows that employee attrition can be anticipated to some extent by examining workplace and employee-related factors. This provides HR teams with an opportunity to identify high-risk employees early and take proactive retention measures before valuable talent leaves the organization.

Recommendations

1. Focus retention efforts on newer employees during their first few years with the company through onboarding support, mentoring programs, and career development discussions.
2. Improve employee work-life balance by reviewing workloads, overtime practices, and flexible work arrangements where possible.
3. Conduct targeted retention reviews for departments and job roles that consistently experience higher turnover.
4. Review compensation and growth opportunities for employees who may be at greater risk of leaving due to dissatisfaction or limited career progression..

Conclusion

This analysis demonstrates that employee turnover is influenced by multiple workplace factors and can be reduced through targeted HR initiatives. By using data-driven insights, organizations can better retain employees, reduce hiring costs, and improve overall workforce stability. The results should be used as a decision-support tool alongside managerial judgment and employee feedback.
